

Thank you for purchasing your new GPS vehicle tracking system!
 Installation of your new GPS tracking device couldn't be easier.
 Just follow these simple steps.

Step 1 > Wiring and Installation

- We recommend installation of your device by a professional installer.
- Please verify that your device is activated prior to installation. When activating a unit, refer to the device MID# on the underside of the tracking device. (Reference Image A.)
- The AT-V3 Pro requires a standard 3-wire installation to operate effectively. Please familiarize yourself with the following wire colors and functions.
NOTE: Do not cut the wiring harness to shorten the length of the cable as this will void the product warranty.

* Red wire	Power	12 VDC constant
* Black wire	Ground	Ground
* White wire	Ignition input	Key (on)
Blue wire	Input 1	(-) to engage
Orange wire	Input 2	12 VDC
Green wire	Output 1	Starter
Brown wire	Output 2	Honk horn/lock doors
Yellow wire	Output 3	Unlock doors/remote start

* Must be connected for device to work properly.

- The **red** wire (power) should be directly wired to a constant 6V - 32V power source found at the key source or fuse panel.
- The **black** wire (ground) should be securely fastened to a grounded screw or to chassis ground.
- The **white** wire (ignition) is the ignition event wire that is best installed directly to the ignition wire. Ensure that power to the ignition wire is available **ONLY** when the vehicle ignition is turned on. All makes and models of vehicles are different - we recommend you make sure that you know your particular vehicle's Constant and Ignition wires and their specific color(s) prior to installation.
- The **blue** and **orange** wires are input wires. These can be used to monitor PTO activity (Power Take Off) such as emergency lights, doors opening, flat-bed operation, buckets, etc.
- The **green**, **brown**, and **yellow** wires are output wires. These can be used for enabling and disabling the starter, locking and unlocking doors, honking the horn, etc.

Step 2 > Status LED Lights

- After installing the unit, and prior to securing it under the dash area, make sure the unit has a solid **green** light and a blinking **orange** light that goes solid for 1 second, then repeats the pattern. See the table for troubleshooting when one or both does not occur. (Reference Image B and Table on Page 2.)

LED 1 (orange) GSM/Cell	Status	LED 2 (green) GPS	Status
Off	Modem off	Off	GPS Off
Slow Blink	Cell Search	Slow Blink	GPS On
Fast Blink	Network Available	Fast Blink	GPS Time Sync
Solid to Fast Blink	Registered but no acknowledgement	Solid	GPS Fix
Blink, Blink, Blink, Solid Repeating Pattern	Registered and received acknowledgement		

Step 3 > GPS/GSM Antenna

- The AT-V3 Pro uses an internal antenna for both GPS and GSM (cellular) signals. The GPS and GSM antennas are located opposite the cables when viewing unit from the top or bottom. (Reference image C.)
- Our device transmits once every 30 minutes if sitting still, or once every 5 or 10 seconds (depending on your rate plan) when the vehicle is moving faster than 4 mph. Driving the vehicle around the block will assist in its first data transmission.
- The best location is under the dash, above the instrument cluster with a full view of the sky through the front windshield. (Reference image D.)
- Make sure the device is kept free from direct exposure to the elements (sun, heat, rain, moisture).
- When installed inside a building, your unit may not receive a GPS signal or cellular signal.
- GPS signals WILL penetrate glass, plastic, foam, fiberglass, and wood.
- GPS signals will NOT penetrate metal.
- A good placement of the device will yield a minimum of 7 satellites.
- The device will not transmit data location with less than 4 satellites in view.
